

Python Basics Quiz

To pass the quiz, you must correctly answer at least 18 of the 20 questions below.

1. Which of the following functions is used to check if a variable matches a specific data type?

2. Which of the following is NOT a form of string concatenation?

```
developer = 'Jessica'  
greeting = 'My name is ' + developer + '.'
```

```
developer = 'Jessica'  
greeting = x'My name is {developer}.'
```

```
greeting = 'My name is '  
developer = 'Jessica'  
  
greeting += developer
```

```
developer = 'Jessica'  
age = 30  
greeting = 'My name is ' + developer + ' and I am ' + str(age) + ' years old.'
```

3. Which of the following functions is used to return the number of the characters in the string?

4. What will `result` be in this example?

```
developer = 'Naomi'
```

```
result = developer.endswith('N') # ?
```

5. What happens when you add a float and an integer?

6. Which of the following is the correct way to define a function?

```
def get_sum(num_1, num_2):  
    return num_1 + num_2
```

```
def get_sum[num_1, num_2]:
```

```
return num_1 + num_2
```

```
def get_sum(num_1, num_2)  
    return num_1 + num_2
```

```
set get_sum(num_1, num_2):  
    return num_1 + num_2
```

7. What will be printed to the terminal?

```
def greet():  
    pass  
  
print(greet()) # ?
```

8. Which of the following statements is false when naming variables?

Variable names cannot be one of Python's reserved keywords such as `if`, `class`, or `def`.

Variable names can only contain alphanumeric characters (a-z, A-Z, 0-9) and underscores (_).

Variable names can only start with a letter or an underscore (_), not a number.

Variable names must have a max length of 10 characters, otherwise Python will throw an error.

9. Which of the following is NOT a supported data type in Python?

10. Which of the following will return a new string with all characters converted to uppercase?

```
developer = 'Jessica'  
  
print(developer.toUpper()) # JESSICA
```

```
developer = 'Jessica'  
  
print(developer.upper()) # JESSICA
```

```
developer = 'Jessica'  
  
print(developer.isupper()) # JESSICA
```

```
developer = 'Jessica'  
  
print(developer.up()) # JESSICA
```

11. Which of the following functions is used to get input from a user?

12. What will be the result for the following code?

```
message = 'Python is fun!'

print(message[0:6]) # ?
```

13. What does the `split()` method do?

This method is used to split a float into a list of substrings.

This method is used to split a string into a list of substrings.

This method is used to split a dictionary into a list of substrings.

This method is used to split a tuple into a list of substrings.

14. What will the following print to the terminal?

```
example_list = ['example', 'dashed', 'name']

joined_str = ' '.join(example_list)
print(joined_str) # ?
```

15. Which of the following functions is used to create a table of 1 to 1 character mappings for translation?

16. What will be the result for the following code?

```
int_1 = 4
int_2 = 2

print(int_1 ** int_2) # ?
```

17. What will be returned from the `find()` method if no substring occurrences are found in a string?

18. Which of the following functions is used to count the times a substring appears in a string?

`hascount()``counter()`

19. What does floor division do in Python?

This operator is used to divide two numbers and round down the result to the nearest whole number.

This operator is used to convert a float to an integer.

This operator is used to raise a number to the power of another.

This operator is used to multiply two numbers and round up the result to the nearest whole number.

20. Which of the following functions is used to round a number to the nearest whole integer?

`round()``floor()``ceil()``float()`
